Open Data Sources

To train a powerful model, the larger the data set, the better -- if it's well-organised and open, that's ideal. The following repositories are standouts that meet all these criteria:

- [Data.gov](#) (home of >150k US government-related datasets),
- [Govcode](#), a collection of government open source projects,
- the [Open Data Stack Exchange](#), and
- this curated list of 'awesome' [public datasets](#)
- this well-annotated list of [data sets for natural language processing](#)
- for biomedical and health data specifically, check out:
 - this [University of Minnesota](#) resource
 - this [Medical Data for Machine Learning](#) GitHub repo

For machine learning models that require a *lot* of *labelled* data, check out:

- [UC Irvine's repository](#)
- Yahoo's massive 13TB [data set](#) comprised of 100 billion user interactions with news items
- Google's [image](#) and [video](#) data sets
- Luke de Oliveira's [Greatest Public Datasets for AI](#) blog post
- CrowdFlower's [Data for Everyone](#)

Finally, here are extensive pages on importing data from the Web into R, provided by [CRAN](#) and [MRAN](#).

Perspectives to approach ideating from:

- Identify a data set \Rightarrow use it to solve a problem
- Identify a problem that you'd like to solve \Rightarrow find an appropriate data set

Your Deep Learning Project I

Ideating

Review

Unit 1

Exercise 1

Unit 2

Exercise 2

Theory III

Theory IV

A Deep Net

TensorBoard

Perspectives to approach ideating from:

- Identify a data set \Rightarrow use it to solve a problem
- Identify a problem that you'd like to solve \Rightarrow find an appropriate data set

Recommended starting points:

- 1 a machine-vision architecture to classify images, e.g.:
 - [Fashion MNIST]
 - a subset of the 5000 categories of images from [Cdiscount's Kaggle challenge]
 - one of the dozens of data sets with the keyword *image* in the title from [CrowdFlower]
 - one of the *Computer Vision* data sets (other than the MNIST data set) in Luke de Oliveira's [blog post]
- 2 an NLP architecture to classify text, e.g.:
 - the Yelp or Amazon sentiment [data sets] detailed in Section 4 of [Xiang Zhang et al.'s paper]
 - the Yahoo! Answers categories data set also detailed in Xiang Zhang et al.'s paper
 - one of the dozens of data sets with the keywords *sentiment* or *text* in the title from [CrowdFlower]
 - one of the *Natural Language* data sets (other than the MNIST data set) in Luke de Oliveira's [blog post]
- 3 a regression model

Recommended starting points:

- 1 a machine-vision architecture to classify images, e.g.:
 - [Fashion MNIST]
 - a subset of the 5000 categories of images from [Cdiscount's Kaggle challenge]
 - one of the dozens of data sets with the keyword *image* in the title from [CrowdFlower]
 - one of the *Computer Vision* data sets (other than the MNIST data set) in Luke de Oliveira's [blog post]
- 2 an NLP architecture to classify text, e.g.:

Theory IV

A Deep Net

TensorBoard

- 1 add callback as in [AlexNet Jupyter notebook]
- 2 use Terminal to navigate to your `logs` directory
- 3 run `tensorboard --logdir=. --port 6006`
- 4 navigate to `http://localhost:6006/` in a web browser
